NEW ZEALAND DOCTORS SPEAKING OUT WITH SCIENCE

Media Contact: Graham 027 304 3627

Date: 11 March 2022

"Total hypocrisy" - COVID-19 positive health care workers can work, unvaccinated healthy workers still banned.

As well as being ineffective, the Pfizer/Cominarty vaccine has proven to be unsafe due to significant numbers of reported and analysed vaccine injuries. New Zealand Doctors Speaking out with Science (NZDSOS), has continuously stated the Pfizer trial data clearly shows the vaccine does not stop infection or transmission. Now, microscopists around the world are expressing concerns when they study the vials themselves.

NZDSOS are resolute that unvaccinated health care workers who desired to protect their health are being wrongfully discriminated against by their former employers, particularly with the mounting evidence of significant and often irreversible harm from the Pfizer/Comirnaty vaccine.

Meanwhile, in the ultimate hypocrisy - sick New Zealand health care workers are now asked to continue to work in hospitals while unvaccinated employees are still banned from their previous employment. All while the government is stating that the New Zealand Health System is under extreme pressure and there is a shortage of health professionals across all disciplines.

Dr Cindy De Villiers, head of digital media for NZDSOS, discusses how the mandates are taking decades of medical knowledge and experience off the table in New Zealand healthcare. "This discriminatory behaviour has not only affected the careers of hundreds of health care professionals, but it has also had a huge impact on the lives of those who desperately need those skills and experience when they are most vulnerable. It has grossly limited the availability of staff and kept sick people dependent on a failing system".

According to the New Zealand Bill of Rights, health professionals, the experts in their fields and in the application of their learning in the real world, should be free to choose whether or not they wish to take part in any medical procedure, especially a novel intervention, still in clinical trials. The New Zealand Government, by instituting a compulsory order forcing all health workers to accept this experimental mRNA medical procedure or lose their careers, is complete coercion and is detrimental to New Zealand.

Recent evidence published in the European Journal of Epidemiology, [30 September 2021](#), states, in its analysis of statistics from 68 countries and 2947 counties in the United States, increases in COVID-19 is unrelated to level of vaccination. "At the country-level, there appears to be no discernable relationship between the percentage of population fully vaccinated and new COVID-19 cases in the last 7 days... Israel with over 60% of their population fully vaccinated had the highest COVID-19 cases per 1 million people in the last 7 days."

More recently, Dr Walensky, CDC director, [admitted](#) she didn't know if variants might reduce the efficacy of mRNA vaccines or if their protection may wane with time. "This is unfortunately what happens when interventions are forced on a population without adequate study and what we have been concerned about since the beginning".

This government is causing immense harm to individuals for no benefit to the country. It is adding fuel to

the fire by allowing unwell, vaccinated staff to work. These policies are clearly not about preventing Covid-19. The question thus is: why are they still in place?

"If vaccination has no link to case numbers, particularly with the Omicron variant, it is not viable or ethical to keep medical professionals away from the much-needed support they give to their patients, any longer," said Dr De Villiers.

NZDSOS again calls for the rollout of this nationwide vaccination campaign to be immediately halted until this experimental Pfizer mRNA vaccine is fully tested and its safety profile fully understood. This blatant hypocrisy in our health system needs to stop. Return the healthy nurses and doctors to work, ease the pressure on our overcrowded hospitals and allow informed consent to be the driving force in medicine once again.
